

Time

Here's a quick reminder about "am" and "pm" — though I'm sure you'll know it already:

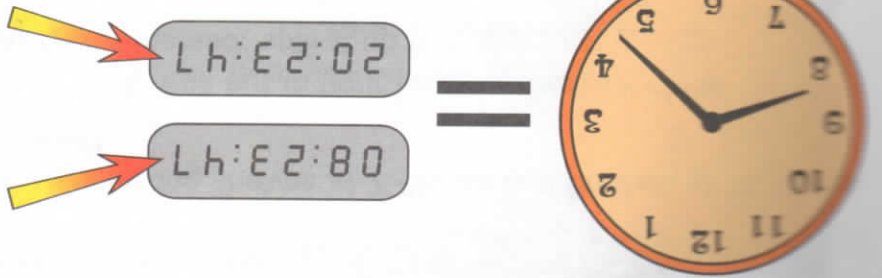

am means "Morning" — it runs from 12 midnight to 12 noon.
pm means "Afternoon and Evening" — it runs from 12 noon to 12 midnight.

The 24 Hour Clock Doesn't Stop at 12

If you've got a video or DVD recorder at home then you'll probably know the 24 hour clock by now. But for those who haven't or don't, this is what it's all about:

The 24 hour time is the **same** as the 12 hour time if it's **morning** (except for the "0" at the front if it's before 10:00).

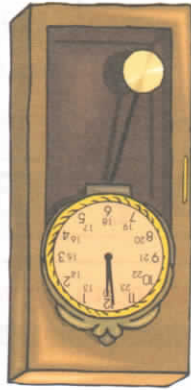

But you have to **add on 12 hours** if it's **afternoon**. So 20:23 is the same as 8:23 pm.

Calendars

When it gets to **midnight**, it goes from 23:59 to 00:00

DON'T FORGET
 1 day = 24 hours
 1 hour = 60 minutes
 1 minute = 60 seconds

What about them? Hm-m-m... Let me think... These are really easy. You just have to **remember** that there are **12 months** OR **365 days** in **one year**. The weird bit is that there are 30 days in some months, 31 in others, and in February there are only 28! There's no way out — you'll just have to **learn** these:

Sometimes there are **29** days in February. This happens once every four years and is called a **leap year**.

"30 days has September, April, June and November, All the rest have 31, Except February alone, Which has 28 days clear, And 29 in each leap year."
